HOW TO GO SAFE ONLINE

Cybercrime is on the rise and it is important for us to protect ourselves so we do not become the next victim. Just as we lock our doors to keep burglars out, we must secure our devices and information to keep ourselves safe from cyber criminals.

Prevention is key in the fight against cyber threats. Here are 4 simple tips to **GO SAFE ONLINE**.

USE AN ANTI-VIRUS SOFTWARE

Install anti-virus solutions on your computer and mobile devices to prevent malware infections, which can cause persistent pop-ups, battery drain or data loss.

Anti-virus solutions can scan and remove malware and block unsafe websites. They are not costly and do not take up much memory. Be wary of fake apps and only install anti-virus software from official app stores.

SPOT SIGNS OF PHISHING

Scammers use phishing emails or websites to get you to disclose your personal information. Clicking on unknown links or attachments could infect your computer with malware.

Look out for mismatched information such as website addresses that are misleading. Be wary of emails that ask for your confidential information, emails you are not expecting (e.g. winning a contest you didn't join), and emails with urgent 'calls to action' (e.g. Your account will be closed).

Watch the videos on these cyber tips!

USE STRONG PASSWORDS AND ENABLE 2FA

Cyber criminals can easily guess or obtain your passwords if they are weak, so don't use personal information (e.g. your name, birthdate, NRIC, etc.) as passwords.

Create long and random passwords by using 'passphrases' that you can remember (e.g. IhadKAYAtoastATBam) and use different passwords for different accounts. Enable 2-factor authentication whenever it's available. It provides an additional layer of verification, which makes it harder for cyber criminals to access your accounts.

UPDATE YOUR SOFTWARE ASAP

Software updates keep your computer and devices safe from known security vulnerabilities.
