

# **RSAC**Conference2015

San Francisco | April 20-24 | Moscone Center

SESSION ID: HTA-W02

## That Point of Sale is a PoS

**Charles Henderson**

Vice President – Managed Security Testing  
Trustwave  
@angus\_tx

**David Byrne**

Senior Security Associate  
Bishop Fox

# CHANGE

Challenge today's security thinking

# Agenda

- ◆ POS Architecture
- ◆ Breach Investigations
- ◆ Testing Techniques
- ◆ Penetration Test Findings

# PoS Attacks: Theory vs. Reality

- ◆ Most breaches involve very simple vulnerabilities
- ◆ Future breaches are likely to leverage more complex vulnerabilities as merchants become more secure
- ◆ Many merchants have very immature security programs

# PoS Purchasing: Security Is Not A Criteria

# **RSA**®Conference2015

San Francisco | April 20-24 | Moscone Center

## Point of Sale Architecture

# Hardware

- ◆ Standard PC workstation
- ◆ Specialized peripherals
  - ◆ Card reader and PIN pad
  - ◆ Barcode scanner
  - ◆ Touch screen – much less “specialized” than it used to be
  - ◆ Expanded keyboard
  - ◆ Scale
  - ◆ Customer display

# Hardware

## ◆ Interfaces

- ◆ USB
- ◆ RS-232 – becoming less common
- ◆ TIA-485/RS-485 – rare in 2015
- ◆ Ethernet – some PIN pads and printers can connect directly to network

# Client Operating System and Software

- ◆ Windows dominates
- ◆ Some Linux
- ◆ Occasional use of network boot with no local storage
- ◆ Even large retailers use off the shelf packages that are customized to the client

# Application Servers

- ◆ Many separate systems:
  - ◆ Transaction records (purchases, refunds, etc.)
  - ◆ Payment card processing
  - ◆ Promotions
  - ◆ Customer tracking
  - ◆ Gift cards
- ◆ May be from entirely different vendors; more likely to see custom software in larger merchants

# Application Servers

- ◆ In larger environments, typically implemented as middleware services: XML web services, etc.
- ◆ Small environments (isolated stores) likely to store all data on register.

# Remote Administration

- ◆ Major source of compromise
- ◆ Registers will almost always have remote administration services
- ◆ Small organizations typically outsource administration
- ◆ Large chains will still not have on-site technical support

# RSAC<sup>®</sup>Conference2015

San Francisco | April 20-24 | Moscone Center

## Breach Investigations

 #RSAC

# Attacks Become More Efficient

- ◆ Physical Modifications (External)
- ◆ Physical Modifications (Internal)
- ◆ Drive-By Malware
- ◆ Scalable Malware

# Physical Attacks (Internal)

# Physical Attacks (Internal)

# Physical Attacks (Internal)

# Forensics Case Study One: Vendor Negligence

- ◆ Same administrator password for nine years
- ◆ Attackers most likely discovered merchant in breach of other merchant using same vendor

```

Username      : Administrator [500]
Full Name     :
User Comment  : Built-in account for
administering the computer/domain
Account Created : Xxx Xxx XX XX:XX:XX 2004
Last Login Date : Xxx Xxx XX XX:XX:XX 2013
Pwd Reset Date  : Xxx Xxx XX XX:XX:XX 2005
Pwd Fail Date   : Xxx Xxx XX XX:XX:XX 2014
Login Count    : 261
                Password does not expire
                Normal user account
    
```

# Forensics Case Study Two: Vendor Negligence

- ◆ Attacker installs memory-scraping malware
- ◆ Data was *manually* retrieved by attacker; memory dumps left on PoS disk
- ◆ Malware easily discovered during investigation using current AV

Scan type: Quick scan

Objects scanned: 191441

Time elapsed: 12 minute(s), 40 second(s)

Files Detected: 2

C:\WINDOWS\system32\Searcher.dll

(Trojan.Clicker) -> Quarantined and deleted successfully.

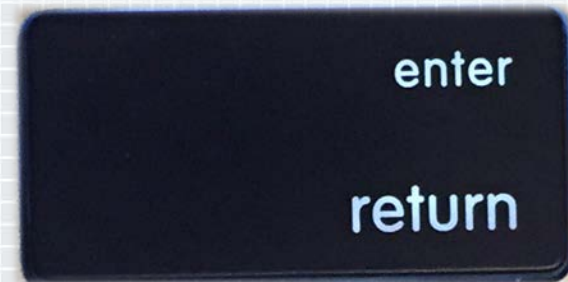

C:\WINDOWS\system32\QOS.dll (Trojan.Agent)

-> Quarantined and deleted successfully.

# Forensics Case Study Three: Vendor Negligence

- ◆ Back of house server configured for remote management utilizing pcAnywhere
- ◆ Null Administrator password
- ◆ Administrator password had not been changed in nine years
- ◆ Malware easily discovered during investigation using current AV

- Key Pressed:

[illegible]

# Backoff Malware

- ◆ Self-propagates through weak remote access authentication
- ◆ Command and control features
- ◆ Memory scraping for payment card data
- ◆ Automatic data exfiltration
- ◆ Keylogging
- ◆ New infections look for old versions of Backoff to remove

```

result = CreateToolhelp32Snapshot(2u, 0);
v1 = result;
if ( result != -1 )
{
    pe.duSize = 296;
    result = Process32First(result, &pe);
    if ( result )
    {
        do
        {
            if ( tcompare_exe_name(pe.szExeFile) && pe.th32ProcessID != current_pid && pe.th32ProcessID > 10 )
            {
                memory_scraping(pe.th32ProcessID);
                Sleep(10u);
            }
        } while ( true );
    }
    for ( i = 0; i < maxAppAddr && VirtualQueryEx(pHnd, i, &buf, 28u); i = buf.BaseAddress + buf.RegionSize )

                }
                rSize = 0;
                if ( ReadProcessMemory(pHnd, buf.BaseAddress + c, lpBuffer, nSize, &rSize) )
                {
                    c += rSize;
                    find_track_data(lpBuffer, rSize);
                }
                else
                {
                    c = buf.RegionSize;
                }
            }
        }
    }
}

```

# **RSAC**Conference2015

San Francisco | April 20-24 | Moscone Center

## Testing Strategies

# Multiple Testing Perspectives

- ◆ Remote (routed) network access
  - ◆ Vulnerable network services
- ◆ Local network access
  - ◆ Proper protocol encryption
  - ◆ Endpoint authentication (i.e., no MitM)
  - ◆ Identification of second-tier application servers

# Multiple Testing Perspectives

- ◆ Momentary physical access
  - ◆ Introduction of malicious device – key-logger, network adapter, USB attacks, IEEE 1394 DMA, etc.
- ◆ Prolonged physical access
  - ◆ Hard drive encryption
  - ◆ Local storage of sensitive data (i.e., payment card numbers)
  - ◆ Analysis of application binaries
  - ◆ Monitoring and modification of key peripherals (i.e. PIN pad)

# Multiple Testing Perspectives

- ◆ Console interaction
  - ◆ Execution of unauthorized and malicious programs
  - ◆ Escalation of system privileges
  - ◆ Modification of PoS application
  - ◆ Monitoring of network and peripheral communication
  - ◆ Memory dumps

# Physical Security

- ◆ Quality of locks
- ◆ Exposed network cables, drops

# **RSAC**Conference2015

San Francisco | April 20-24 | Moscone Center

## Penetration Testing Results

 #RSAC

# Physical Security

- ◆ This is not good physical security
- ◆ Easy access to USB, Ethernet, etc

# Physical Security

- ◆ This is not a good lock

# 166816 (Z66816)

- ◆ Since 1990, this has been the default password for all products from a major vendor
- ◆ Publically documented in a 1994 alt.2600 FAQ (featuring terms like “sysop” and company names like “Northern Telecom”)
- ◆ 90% of the terminals of this brand we test for the first time still have this code

# Improper Use of Symmetric Keys

- ◆ Symmetric algorithms: one key for both encryption and decryption
- ◆ Asymmetric algorithms: decryption & encryption keys separate
- ◆ Using symmetric algorithms for payment card data invites abuse

# Operating System Security

- ◆ Most POS deployments are overly reliant on passwords
  - ◆ Very difficult to secure OS passwords on endpoint
- ◆ AV scanning isn't perfect, but still important
- ◆ Easy to introduce custom malicious executables
- ◆ No drive encryption
  - ◆ Simplifies offline attacks
  - ◆ Allows stolen devices to be used for analysis
  - ◆ Devices get stolen

# Authentication Fail

- ◆ Single set of authentication credentials across enterprise
- ◆ Automatic Windows login and local enforcement of POS user authentication – no authentication against networked application services

# Running as administrator

- ◆ Vendors often claim that this is a requirement.
- ◆ Lies, nothing but lies.
- ◆ Windows and Unix-like operating systems have never worked this way.
- ◆ Simply an excuse for lazy programmers

```

## Plaintext Network Traffic

Note the protocol. This is not IP.

# Running Unauthorized Programs

- ◆ This is how malware infections start

# Network Communication Security Flaws

- ◆ Plaintext communication
- ◆ Failure to authenticate endpoints
  - ◆ SSL is next to useless without certificate verification

# Encryption Insanity

- ◆ Symmetric encryption used for transmission of payment cards
- ◆ Point-to-point-to-point encryption (one too many points)\*
- ◆ XOR to protect passwords; programmers are always amazed that we can reverse this

\* Note: The addition of more points does not enhance security posture.

# PIN Pad Security

- ◆ Default configuration often insecure
- ◆ Can almost always be reprogrammed from register
  - ◆ Convenient way of implementing management across enterprise
  - ◆ Some code is cryptographically signed
  - ◆ Configuration is almost never signed
  - ◆ Attacker may be able to disable security controls such as end-to-end encryption

# PAN Abuse

- ◆ Coupon printer using PAN to track customers
- ◆ PAN returned to PoS for truncation
- ◆ Purchase history stored for tracking fraud – 37 million numbers
- ◆ Adding drives to register store growing debug transaction logs

## Card Numbers in RAM

# Symlink to Access Filesystem

# **RSAC**Conference2015

San Francisco | April 20-24 | Moscone Center

**Apply:  
PoS Security Program**

# Implement a PoS Security Program

- ◆ *Always verify the security claimed to be implemented by vendors*
- ◆ Top priorities:
  - ◆ Ensure no payment card data is stored on registers
  - ◆ Enforce strong authentication policies
  - ◆ Don't run PoS user interface as "administrator"
  - ◆ Stay current on patches and AV signatures

# Implement a PoS Security Program

- ◆ Secondary priorities:
  - ◆ Evaluate security of data communication (encryption, certificate checks, etc.)
  - ◆ Pen test application servers for application vulnerabilities
  - ◆ Lock down client execution environment
- ◆ Final efforts:
  - ◆ Use strong authentication (key/certificate-based)
  - ◆ Implement end-to-end encryption with asymmetric keys

# RSA®Conference2015

San Francisco | April 20-24 | Moscone Center

## Q & A
