

# Reimagining Vulnerability Management in the Cloud

#### Cloud Vulnerability Management

#### **Our Cloud Journey**

Cloud Vulnerability Management Lifecycle

The Great Debate: Pets & Cattle

Zero Day Advances

**Cloud Native Tooling** 

#### Our Cloud Journey – Initial Expectations

- Started journey back in 2018
- Multi-vendor cloud strategy
- Enable Self Service model
- Migrate existing applications
- Focus on speed of adoption
- Embrace DevOps
- No pets allowed mentality, everything CI/CD
- Enable rapid series innovation
- Embedded Security (seamless)
- Process automation

Cloud Transformation • DevOps • App modernization • New Roles & Responsibilities • Continuous Learning & Teaching

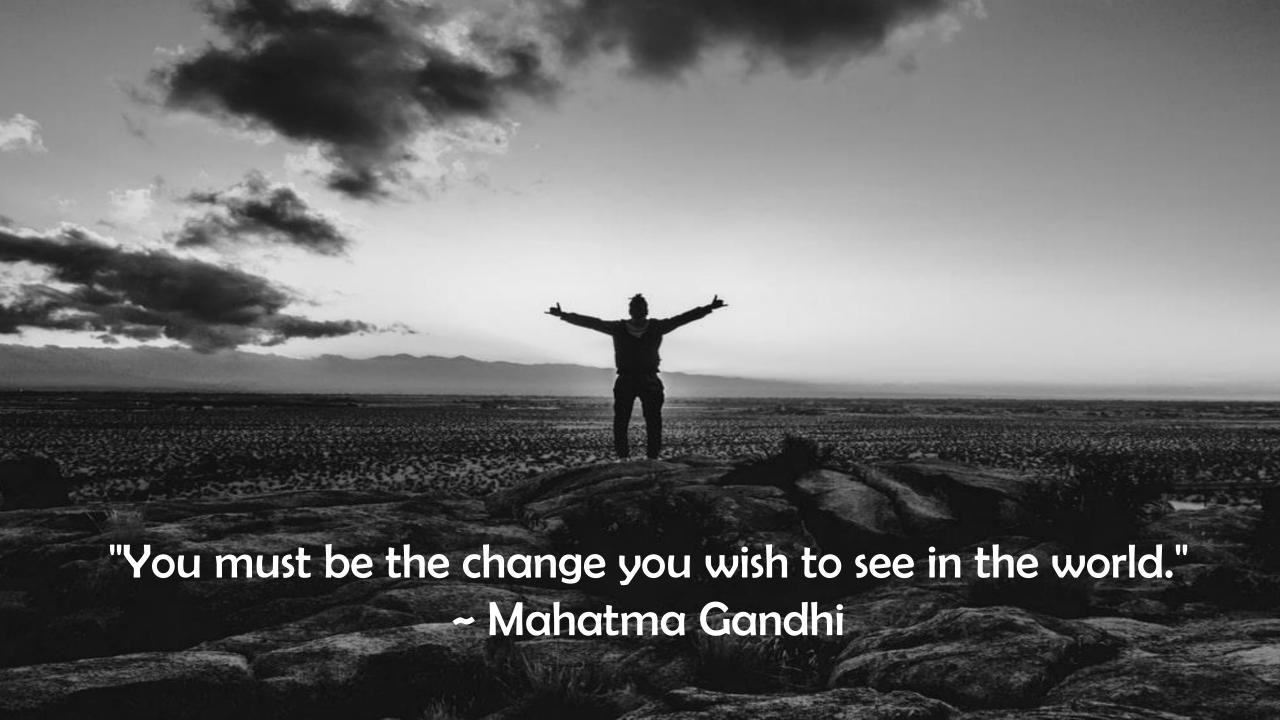

#### Our Cloud Journey - Reality

Change is hard.

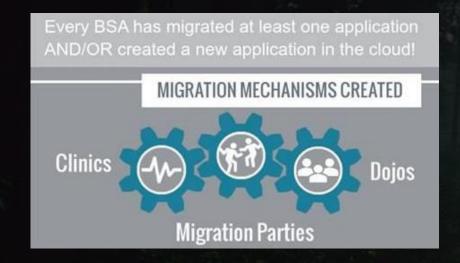

There is comfort in familiar ways.

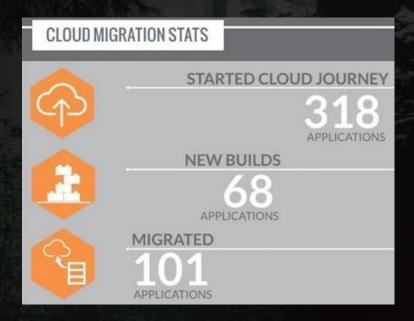

Change means being uncomfortable.

#### **Our Cloud Journey**

2019 Migration Statistics

#### Our Cloud Journey – A few lessons learned

- Not all applications can reach or need full CI/CD pipeline
- 3<sup>rd</sup> party applications, vendors need to provide SaaS, Marketplace, or Cloud template solutions instead of migrating non-cloud certified packages
- Container adoption was easier and more broadly accepted
- We now have lots of Pets, but a whole lot of innovation!!!

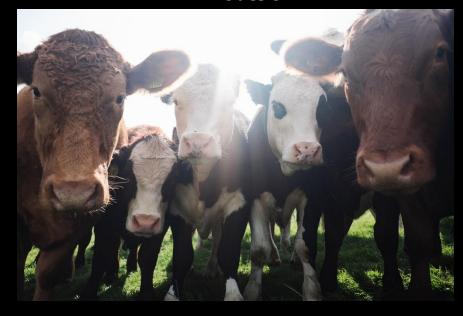

#### Pets + Cattle + Ghosts

Pets

Cloud instances that need taken care of.

Cattle

Cloud instances built using automated tools and designed for failure.

**Ghosts** 

Cloud instances that existed once and may reappear as a different instance. Instances that are running and no one knows they exist.

## Foundational Vulnerability Management Lifecycle

Prepare – Asset Management

**Identify** – **Detection** 

Analyze - Reporting

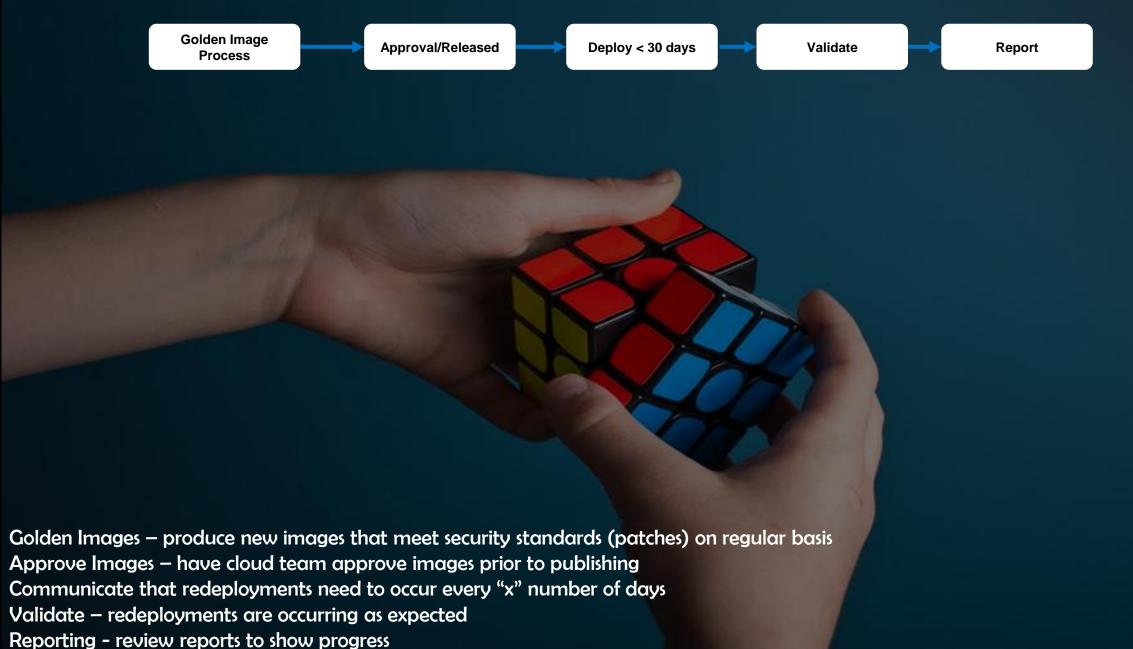

Communicate - Planning

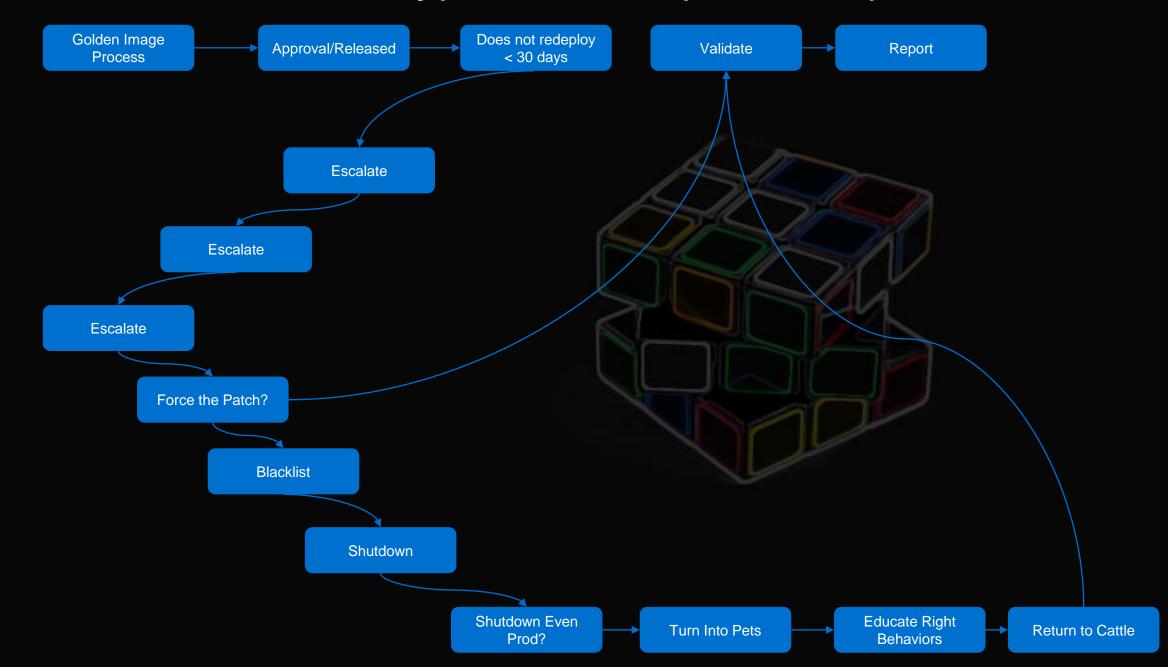

Remediate - Patching

#### When cloud vulnerability practices are operating as expected

#### When cloud vulnerability practices are not operating as expected

#### 10 Things that you should consider for cloud vulnerability management

- 1 Accurate inventory of cloud assets
- 2 Determine scanning / detection tooling across CSP's
- 3 Test zero day response plan
- Integrate data into reporting tools
- 5 Address containers differently than EC2, etc.

- 6 Patch tooling and support (disk space, access, etc)
- Process map all vulnerability management processes for cloud and document
- 8 Clear communication on roles and responsibilities and pets vs cattle
- 9 Plan for Non-Compliance escalate, blacklist, shutdown?
- Review vulnerability reporting on regular basis

#### Automation for the win!

Asset Inventory – system that can pull asset information automatically on regular basis

Scanning / Detection – Configure automated scanning, daily, weekly, or monthly basis. Use cloud native services where possible

Golden AMI - Implement an approval process before images are released. Have security team review standard installed software (security agents) and review vulnerability reports

#### Automation

Automate deployments, require app teams to rehydrate their applications every "x" days per your policy

Review your processes, look for opportunities for automation / efficiencies

Automate with blacklisting, don't allow images to run if they are out of compliance

#### Automation

Integrate scanning tool outputs into your reporting mechanisms

Put accountability back on the application teams to redeploy in order to maintain compliance

#### Zero Day Advances

So you've discovered a new zero day...

So you've discovered all impacted assets...

So you think you've patched everything ....

Now you've reported all vulnerabilities have been mitigated...view-device" of the last of

But wait, there's more....

```
(), window.confirm(value).fadeOut(350, further state).fadeOut(350, further state).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.state(value).firstlender.st
```

Cloud assets are dynamic in nature. New instances spin up and down all the time...

#### **Example Tooling using Cloud Native Services**

### Questions

"There's a way to do it better - find it."
- Thomas Edison
